

*Personal Growth Report. What did you learn, where did you struggle, any great a-ha moments? Number of hours logged on this project/assignment*

In this assignment, I learned how to use HTML and CSS, which are brand new skills for me. I majored in Finance when I was at my undergraduate study, so this is the first time I have done so much coding work.

The problem I struggled most is that when I was writing my Education Experience, the hyperlink in my navigation frame could not be clicked and I spent more than an hour to check what on earth the problem was. Fortunately, I used developer tools and found that the area of the hyperlink was covered by the margin of my picture. From then on, I finally realized the function of a picture's margin and how it could affect my website, and how important it is to realize the overall layout of a website. What I have done in the assignment was not to establish a website but to draw a static picture with texts in it. And I did not understand the meaning of using external CSS document when I was writing my HTML. The result for this was that my HTML was mixed with CSS, which caused difficult for me to modify some attributes. So, I spent a lot of time doing the same thing for 5 separate pages!!

The best time for me was when I found my website was so clear and beautiful compared to my group members'. However, I found the worst problem for me is that I still could not realize the fundamental functions of some tags and attributes. The appearance of my website could be in a mess when I adjust the size of the browser.

I spent no less than 15 hours on my assignment. When I thought back why I spent so much time was that my total understanding of HTML and CSS was so shallow. I did not use external CSS document to standardize my website, and I changed attributes of pictures and texts one by one.

*Any other feedback. How can we improve this assignment for future students?*

As a student who did not have any experience in Information Science. I hope you could demo some website in class so that we could follow you better and have a better understanding of overall understanding of HTML and CSS and some tags and attributes. Since I am not very good at English, reading the book cannot leave me a deep understanding of those contents. Anyway, I learnt a lot in our class! Thank you so much!
